

# Lab 4: Traffic Escape - Chat History

Dhruv U | PES2UG24AM054 | 9 October 2026

Scope: user-facing conversation through packaging. Tool calls, tool output, and hidden instructions are excluded. The final response occurs after this export. Use the platform Share control to provide the complete chat page link required by the repository checklist.

## User

Selected the GitHub plugin and attached Lab\_4\_VibeCoding\_Student\_handout(2).pdf.

## User

[https://github.com/SETAPESU26/50\\_traffic-escape](https://github.com/SETAPESU26/50_traffic-escape)  
do everything in this

## Assistant

I'll read the lab handout and inspect the repository, then work through the implementation and required deliverables.

## Assistant

The repository asks for four features: three lives, a moving raft lane, persistent top-five scores, and a day/night cycle. I also found that the player can move below the screen and cars can hit it on the starting sidewalk.

I'm using the PDF skill to check the handout. It requires separate commits and 10-second before/after videos. I'll prepare those with the code. Your GitHub connection hasn't returned a personal repository yet, so the push destination is still unresolved.

## Assistant - repository choice

Which personal repository should receive the completed Lab-4 folder? Options: SE-Lab1 (Recommended); Different repository.

## User - repository choice

Different repository

## Assistant

All four features now have separate commits, along with a commit for the original bugs. The before video captures the unmodified game letting the player move below the screen. I'm checking collisions, raft movement, score persistence, and the 30-second lighting transition next.

You selected a different repository, but no URL came through. I'll finish the submission package; I'll need that URL to push it.

## Assistant

The seven gameplay tests pass. They cover all three lives, restart, raft carrying and drowning, score persistence, movement bounds, and the day/night transition.

Both 10-second videos are recorded from the game using scripted keyboard input. The after video combines clips of the boundary fix, raft crossing, and the normal 30-second night transition, with labels explaining the cuts. I'm packaging the code, commit history, videos, and a record of this implementation session.
